

### CANTON OF VALAIS

#### A pragmatic approach, stamped with innovation and quality

The skills of this company are oriented towards the publishing of management software and its integration into sectors as diverse as industry, services, finance, insurance and public administration. TI Informatique puts forward solutions from the Xpert.Line range aimed at organisations of all sizes, ranging from the SME or a community of 300 inhabitants to multinationals and state organisations. It distributes its products in Switzerland and throughout Europe across a wide network of partners. Armed with experience acquired over 25 years and boasting in excess of 140 staff members, TI Informatique demonstrates a pragmatic approach, stamped with innovation and quality. Rather than offering traditional “monobloc” applications, the strategy of this company is focussed

on the development of application modules published in service form (SOA – service oriented architecture). Each client can therefore construct its own information system by integrating the components it needs, and at the most opportune moment (time to market). This flexibility is complemented by a business process management product (Xpert.Ivy) allowing modelling to take place, then guaranteeing the perfect implementation of all the organisation’s horizontal management structures. Maintaining relations with the prestigious higher education institutes as well as actively contributing to economic advancement form part of the desire of TI Informatique to perpetuate a genuine project for entrepreneurs.

#### New protection solutions

SECU4 develops for its client new protection solutions for valuables and people based on wireless technologies. SECU4 vision is to bring the security feeling to everyone through innovative electronic products at an affordable price. In 2009 SECU4 has been selected by Red Herring in the Top 100 of the most promising start-up company in the world in San Diego, USA. In February 2007, SECU4 Sàrl was founded. The company has since developed and industrialized the BlueWatchDog. Mid 2008, with the support from investors (“smart money”), the company grew into a limited company (SECU4 SA) and kept on developing mobile protection solutions for valuables and persons based on wireless technologies.

The BlueWatchDog is the first product developed by

SECU4. The product is currently sold in France, Germany and Switzerland and is spreading its presence all over the world. BlueWatchDog is a credit card-sized device with multiple uses, from protecting your notebook, wallet, or luggage to keeping a close watch over people – such as your children.

The BlueWatchDog may be configured to provide protection for distances ranging from 5 to 30 meters. If the protection radius is exceeded, the user receives an alert on his mobile phone and the 100dB alarm on the card is automatically triggered in order to protect the valuables.

SECU4 already develops the next generation of product dedicated specifically to child protection. The launch of the product is planned for the end of this year.
